Vector NTI Viewer is designed to help biologists by displaying biological molecules in a user-friendly way. In addition to viewing gene sequences, it can also display the restriction sites, ORFs and protein alignments, allowing you to perform a thorough analysis of the biological molecule. Vector NTI Viewer is intended to assist researchers in viewing biological molecules and performing a thorough analysis on their structure. Vector NTI Viewer Vector NTI Viewer is intended to assist researchers in viewing biological molecules and performing a thorough analysis on their structure. Aside from Vector NTI molecule documents, it is compatible with data extracted from FASTA, GenBank, or EMBL files, as well as nucleotide sequence ASCII files. All types of files can be either opened using the designated option in the File menu or pasted directly from the clipboard. In addition to this, the application allows you to open multiple source files simultaneously, for comparison purposes. The main window is split into three different panes, one dedicated to displaying the molecule components, one for viewing the formatted nucleotide sequence alignment and the last for graphically representing the molecule structure in circular or linear mode, with text annotations to help you understand its composition. Selecting a part of the graphical representation immediately highlights the corresponding piece in the nucleotide sequence. The functionality of Vector NTI Viewer is limited to displaying the molecule, so editing is not possible. Vector NTI Viewer enables you to view the component fragments that compose the molecule and get an overview of its functional and restriction maps. You can also search for restriction sites and ORFs or translate sequences. Diagrams can be printed using the default peripheral or copied to the clipboard, which allows you to insert them in presentations or other projects. Vector NTI Viewer can be used by both expert scientists and biology students. Its practical use extends from the educational field to expert researching, allowing the generation of intelligible virtual representations of biological molecules. Nucleotide Sequences Nucleotide sequences are the basic building blocks of life. Over 95% of the human genome consists of nucleotide sequences. They are made up of four different chemical components: A: is the nucleotide that codes for the amino acid alanine C: is the nucleotide that codes for the amino acid cysteine G: is the nucleotide that codes for the amino acid glycine T: is the nucleotide that codes for the amino acid thymine If a nucleotide contains a certain pattern of these four chemical components (that is, an A, a C, a G or a T), it is a codon. A codon is a specific sequence of three nucleotides (a triplet) that codes for a specific amino acid. Codons are classified into three groups: Nucleotides that cannot be translated into amino acids are called nonsense codons (AUG is a typical nonsense codon). Nonsense codons signal the termination of a peptide chain. Strings of three or more same nucleotides are called repeats. The consensus sequence for the A or T nucleotide in a codon is CG (A: C, T: G). A string of nucleotides is called a string of nucleotides. You can find more details about nucleotide sequences on Wikipedia. FASTA FASTA format is a text file format used for storing sequences and sequence alignments. FASTA file format was introduced by the European Molecular Biology Laboratory in 1992. FASTA Files: A: The 5' end of a nucleotide sequence B: The 3' end of a nucleotide sequence 1: The sequence of the central part of the nucleotide sequence 2: The sequence of the central part of the nucleotide sequence, repeated. Sequence Alignment It is a visual representation of the multiple sequence alignment of two or more nucleotide sequences. Sequences are aligned using a program that provides different algorithms to generate the best possible alignment. A simple example of nucleotide sequence alignment is a genetic code. Sequence Alignment Examples: Sequences alignment is used in bioinformatics to study the relationships between sequences. There are several types of sequence alignment such as nucleotide sequence alignment and protein sequence alignment. Both nucleotide sequence alignment and protein sequence alignment
