Some of the important features essential to Photoshop cannot be sponsored by the software. They belong to its core functionality. And the development of any software is directly proportional to the development of its core functionality. The next section will look at top 10 top 10 features, which define Photoshop. When a photographer decides to retouch a picture, she or he doesn't want any background distraction. The photographer realizes that the camera as a part of the system, makes the final output. While some of the features (for example: blur) are very visible, the background is invisible. Thus it is very possible for a photographer to work on anything more than just the picture. But Photoshop is good with correcting, altering the background or even a person's face. Photoshop is capable of making a background invisible and even hair color could be altered. The Photoshop editing tools are not strong enough to completely remove all the UV markings. In Photoshop, there are filters to improve the quality of the photo. These filters improve detail and trailing. But in the chapter, they do not work for certain pictures, such as a snapshot or a picture with a white background. There is also the ability to use custom selection and color/opacity adjustments. Photoshop has the help, and even the individual can choose to apply different color adjustments. The Brush Tool Photoshop is used by a photographer to paint out the background. The selection pops out on the monitor to mark the area, for the brush to paint on. The brush allows the user to paint with a straight line stroke. In the selection, the size can be adjusted. It can be very small, or the curve can be sharp and fine. The corner of the brush has a cap that can be adjusted.
